

IROPS Disruption Management Policy

Purpose

Synthetic policy for operational handling of cancellations, weather, and other irregular operations.

Disruption Assessment

Classify each disruption by type, severity, and operational status before recovery actions are selected.

Cancellation

For a cancelled flight, identify affected passengers and evaluate feasible recovery options.

Weather

Weather disruptions may affect aircraft movement, airport operations, crew availability, and downstream connections. Recovery must use current operational data rather than assumptions.

Recovery Principle

Safety and feasibility take priority over optimization objectives such as minimizing passenger delay.

Escalation

Cases with no feasible automated recovery should be surfaced for human operational review.
