

IROPS Rebooking Policy

Purpose

Synthetic policy for the IROPS Recovery Copilot demonstration.

Rebooking Priority

Consider the earliest feasible alternative. Passengers with onward connections should receive higher operational priority when a disruption threatens their connection.

Alternative Flight Selection

Prefer the same origin and destination when feasible. Earlier departure is preferred when capacity and operational constraints permit.

Capacity

The recovery system must respect available seat capacity. An alternative flight must not receive more recovered passengers than its available seats.

Feasibility

A rebooking is feasible only when route, schedule, capacity, and connection constraints are satisfied.

Unresolved Passengers

If no feasible alternative exists, the passenger remains unresolved and should be escalated for manual operational handling.
